LAB ASSIGNMENT 1

PART 1

Goal: To decrypt “ciphertext1”

Available Data

- **Plaintext: ASCII file**
- **Key: Upper – lower case characters and numerals**
- **Map [16] [16]: The ciphertext’s 4 higher or lower bits (ch,cl)**
 - Rows: 4 higher or lower bits of the plaintext (ph, pl)
 - Columns: 4 higher or lower bits of the key (kh, kl)

PART 1

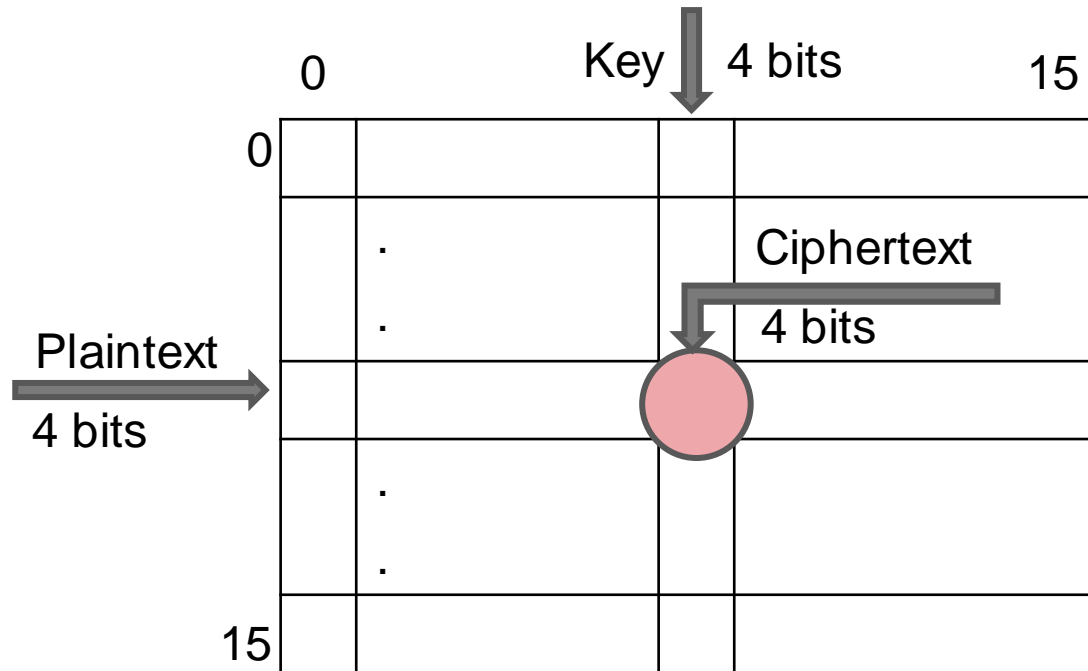

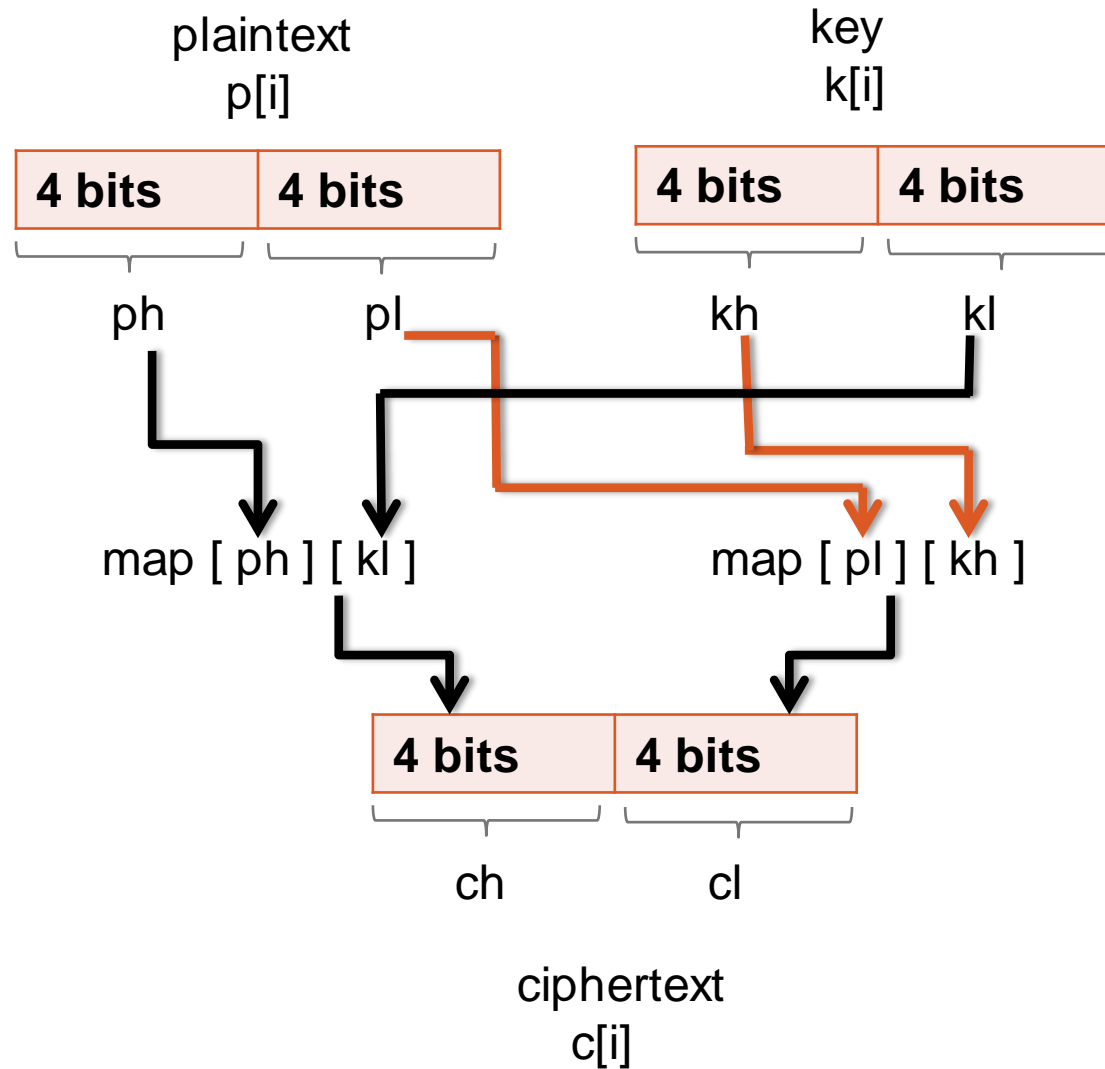

Figure 2: Encryption table

PART 1

PART 1

- **How is encryption performed?**

Example: Suppose that the plaintext to be encrypted is “hello!” and the keyword is “key”.

Step 1: Extract p_h , p_l from the byte p and k_h , k_l from the byte k

Step 2: Use these formulas to find the values of c_h and c_l in the map

$c_h \leftarrow \text{map}[p_h][k_l]$

$c_l \leftarrow \text{map}[p_l][k_h]$

Step 3: Combine c_h and c_l into the byte c

Figure 4: The map table

PART 1

Example: Plaintext letter is 'h' and key letter is 'k'

ASCII code for 'h' is 0x68 and for 'k' is 0x6B

So, $ph = 0x06$, $pl = 0x08$, $kh = 0x06$, $kl = 0x0B$

$ch = \text{map} [ph] [kl] = \text{map}[0x06][0x0B] = 0x04$

$cl = \text{map} [pl] [kh] = \text{map}[0x08][0x06] = 0x07$

So, the ciphertext byte is 0x47

PART 1

What about the decryption?

- How can we use the information provided by the map table for decryption?
- Looking for ph and pl given ch,cl and kh,kl
 - $ch = \text{map}[?][kl]$
 - $cl = \text{map}[?][kh]$

PART 1

▪ Decryption Example

- Ciphertext byte = 0x47, key character = k (ASCII 0x6B)
- $c = 0x47$, $ch = 0x04$, $cl = 0x07$
- $k = 0x6B$, $kh = 0x06$, $kl = 0x0B$
- How to find ph and pl using the map?
 - $map[?][0x0B] = 0x04$
 - Which row in column B has value of 0x04?
 - Row 0x06
 - $map[?][0x06] = 0x07$
 - Which row in column 6 has value of 0x07?
 - Row 0x08
- So, $ph = 0x06$ and $pl = 0x08$ and $p = 0x68$ (ASCII for 'h')

PART 1

Time for some HINTS ...

Hint 1: The plaintext is ASCII, and the key is a combination of upper and lower case characters and numerals. Use these facts when searching for the key.

Hint 2: How could you use the frequencies of character occurrence in ASCII text of a language, as well as the potential character at a given position, to automate the process of recognizing the right key?

PART 2

Goal: To decrypt “ciphertext2”

Available Data

- **Plaintext: File of a commonly used file format**
- **Key: Any combination of printable ASCII characters**
- **Map [16] [16]: The ciphertext’s 4 higher or lower bits (ch,cl)**
 - Rows: 4 higher or lower bits of the plaintext (ph, pl)
 - Columns: 4 higher or lower bits of the key (kh, kl)

PART 2

Hint 1: The plaintext is a common file format. Consider the possibility that the file format corresponding to *ciphertext2* may not observe standard frequency characteristics.

Hint 2: The key for *ciphertext2* can be any combination of printable ASCII characters. Thus, the key used to encrypt *ciphertext2* is **not** restricted the same way as the key that encrypted *ciphertext1*.

Hint 3: The key is substantially longer than the one for *ciphertext1*.
